

Hello and welcome to another video in the Jutro Digital Platform intro series.

In this video, we will take a look at how Jutro Digital Platform facilitates your P&C app journey from development to production.

We open Jutro Web apps and navigate to the 'deployments' tab.

Here, we see different instances, or builds, of the same app, each derived from distinct code branches.

We select one of the deployments currently in the development stage and initiate its promotion to the pre-production environment.

It's important to note that only one deployment is allowed at any time for pre-prod and prod.

So, promoting this existing deployment from development will replace the existing deployment in pre-prod.

Next, we proceed to specify integrations, custom domains, and authentication for this deployment.

After configuring these details, we click 'promote'.

As the promotion process begins, we can monitor its progress under the pre-prod section.

Once the promotion is complete, we preview the app in its pre-prod stage.

This preview shows the app in its developmental stage, but now situated in pre-prod, featuring the promoted

Build number 22.

This demonstration highlights the Jutro Digital Platform streamlined process for advancing an app from its

development phase to pre-production.

This setup paves the way for a successful production launch.

It's crucial to remember that only pre-prod deployments can be moved to Production, and similar to pre-prod,

only one deployment can exist in prod.

Promoting a deployment from pre-prod to prod will overwrite any existing deployment in prod.

And that's how we promote a Jutro app from development to pre-prod to prod.
